Keywords	NTAG 424 DNA, NTAG 424 DNA TagTamper, Configuration, Personalization
Abstract	Guidelines for personalization, configuring and backend calculations of NTAG 424 DNA

## Revision history

Rev	Date	Description
v 1.8	20201117	Typo corrected in [Table 19]
v 1.7	20201112	Typo corrected in [Table 19]
v 1.6	20201022	Typo corrected in [Table 17], [Table 18]. Details added for [Section 7.4]
v 1.5	20190730	Editorial changes
v 1.4	20190612	More details added on Asymmetric Originality Check procedure
v 1.3	20190322	Typos corrected in chapters <a href="#">Section 4.4.2</a> and <a href="#">Section 7.2</a>
v 1.2	20190211	Personalization steps updated, Originality Signature check added
v 1.1	20190129	Security status changed into "Company Public"
v 1.0	20181031	Initial version

## 1 Abbreviations

Table 1. Abbreviations

Acronym	Description
AES	Advanced Encryption Standard
AID	Application IDentifier
APDU	Application Protocol Data Unit
DF-Name	ISO7816 Dedicated File Name
C-APDU	Command APDU
CMAC	MAC according to NIST Special Publication 800-38B
CRC	Cyclic Redundancy Check
IC	Integrated Circuit
KDF	Key derivation function
LRP	Leakage resilient primitive
LSB	Lowest Significant Byte
LSb	Lowest Significant bit
MAC	Message Authentication Code
NDEF	NFC Data Exchange Format
NFC	Near Field Communication
NVM	Non-volatile memory
PCD	Proximity Coupling Device
PICC	Proximity Integrated Circuit Card
PRF	Pseudo Random Function
R-APDU	Response APDU (received from PICC)
SDM	Secure Dynamic Messaging
SSM	Standard Secure Messaging
SUN	Secure Unique NFC Messaging
UID	Unique IDentifier
URI	Uniform Resource Identifier
URL	Uniform Resource Locator

## 2 Introduction

NTAG 424 DNA introduces a feature called Secure Dynamic Messaging (SDM), which returns a unique secure dynamic response at each tap. NFC forum devices, which have built-in NFC hardware (e.g. NFC mobile phones, tablets), open the link without any dedicated application installed in the device. The "tap unique" NDEF message offers to the backend system (e.g. cloud) a unique tag identifying.

### 2.1 About this document

This document addresses developers who are developing application based on NTAG 424 DNA.

This application note is a supplementary document for implementations using the NTAG 424 DNA. This document shall be used in addition to NTAG 424 DNA data sheet [1]. The best use of this application note is achieved by reading the mentioned data sheet in advance.

**Note: This application note does not replace any of the relevant functional specifications, data sheets, or design guides.**

### 2.2 Key benefits using NTAG 424 DNA

- More advanced security, through cryptographic authentication and unique authentication data mirror with each tap
- Stronger protection of goods and documents, with tap-to-check content originality, integrity, authenticity
- Enhanced user engagement, with unique content experiences served in real time (e.g. cloud)
- Easy user adoption, through automatic tag connection to web services –no dedicated app needed

### 2.3 Target applications

NTAG 424 DNA is attractive for many applications. To name few in the list below:

- **Advanced anti-counterfeiting**  
Verify authenticity of physical goods and identify sales outside authorized markets.
- **Secured exclusive user experiences**  
Reward customers with truly exclusive and personalized content, offers, and privileges.
- **Secured sensitive data applications**  
Protect sensitive product and user data, or trigger an action upon a verified incidence.e.g. payment.
- **Document Authentication**  
Authenticate originality and track provenance of documents that bear credentials.
- **Protected monetary offers**  
Confer trust to proximity transactions such as coupons, promotions, or loyalty points.
- **Secure authentication and configuration of closed loop devices**  
Authenticate consumables and parts, and enable automated transfer of device settings.
- **Verified physical visitor presence**  
Enable secure visitor authentication, with proof of live presence and service records.

- **Secure log-in credentials**

Protect web services using two-factor authentication logons to sensitive content sites.

## 2.4 Standards compliancy

### 2.4.1 ISO 14443

NTAG 424 DNA is fully compliant to all layers (1, 2, 3, 4) of ISO/IEC 14443 [\[3\]](#).

### 2.4.2 ISO 7816-4

NTAG 424 DNA is fully compliant to ISO/IEC 7816-4 [\[6\]](#).

### 2.4.3 NFC Forum compliancy

NFC tag is a contactless tag capable of storing NDEF data, which interoperates with ISO 14443 infrastructure (or other) and NFC devices as defined by the NFC Forum specifications. NFC Forum defines logical data structure for storing NDEF message on a Tag.

The file structure on NTAG 424 DNA complies to NFC Forum Tag 4 Type [\[5\]](#). There are two (2) required files:

- CC file is 32 bytes large, generally used for defining NDEF structure, info on access rights for NFC device, optionally presence of Proprietary Files. It is pre-personalized as NFC Forum Tag 4 Type, NDEF V2.0.
- NDEF file is 256 bytes large. On delivery, it is empty and all type of NDEF messages/records can be programmed.

### 3 Definition of variables used in examples

The following symbols are used to abbreviate operations in the examples:

Symbol	Description
"=	Preparation of data by SAM, PICC, or host
"<" or ">"	Direction of communication
	The concatenation operation
$\oplus$	exclusive-OR operation
$X \ll 1$	The bit string that results from discarding the leftmost bit of the bit string X and appending a '0' bit on the right
$0^s$	The bit string that consists of s '0' bytes
$E_{AES}(K_x, M)$	AES-128 encipher in CBC mode, IV all 0x00, using key - K of number x, M is cipher input
$D_{AES}(K_x, M)$	AES-128 decipher in CBC mode, IV all 0x00, using key - K of number x, M is cipher input
$E_{LRP}(K_x, M)$	LRP encipher using key - K of number x, M is cipher input
$D_{LRP}(K_x, M)$	LRP decipher using key - K of number x, M is cipher input
$MAC(K, M)$	Message authentication code of message M using secret key K
$MAC_t(K, M)$	Truncated message authentication code of message M using secret key K. Truncated to 8 bytes, using $S_{14}    S_{12}    S_{10}    S_8    S_6    S_4    S_2    S_0$ . Even-numbered bytes shall be retained in MSB first order.
$KDF: PRF(key, message) = CMAC(K_x, message)$	A NIST recommended key derivation using pseudorandom functions. Pseudo random function: CMAC algorithm

### 3.1 Byte order

#### 3.1.1 LSB representation

Represented least significant byte (LSB) first are:

- plain command parameters consisting of multiple bytes
- ISO/IEC 14443 parameters during the activation

#### 3.1.2 MSB representation

Represented as most significant byte (MSB) first are:

- cryptographic parameters
- keys
- random numbers exchanged during authentication
- TI (Transaction Identifier)
- computed MACs

## 4 Secure Dynamic Messaging (SDM)

Allows for confidential and integrity protected data exchange, without requiring a preceding authentication.

Secure Unique NFC message (SUN) enables user experience in a secure and convenient way. It applies to NDEF file only. Configured static or dynamic values are mirrored as text (ASCII encoded) into the NDEF message (e.g. URL) on each NFC tap [Section 4.2].

NTAG 424 creates the SUN at power-up procedure, within ISO/IEC 14443 time and  $H_{MIN}$  limits.

### 4.1 Mirroring commons

1. Content is mirrored within the NDEF, only in non-authenticated state
2. Mirrored content (dynamic data) overlays below "place holding" content (static data)
3. Independently configurable what to mirror (UID, Counter, Part of static data, Tag Tamper status, CMAC)
4. Independently configurable where to mirror
5. ASCII encoded (to represent 1 byte – 2 characters are needed)
6. Any separator of any length between mirrors can be set
7. For each mirror following has to be defined:
  - starting offset
  - length
8. Mirror starting position (**offset**) + mirror **length** must not overlap with any other enabled mirror

Few mirroring examples:

Figure 1. UID, NFCCounter (PICCData) and CMAC mirror

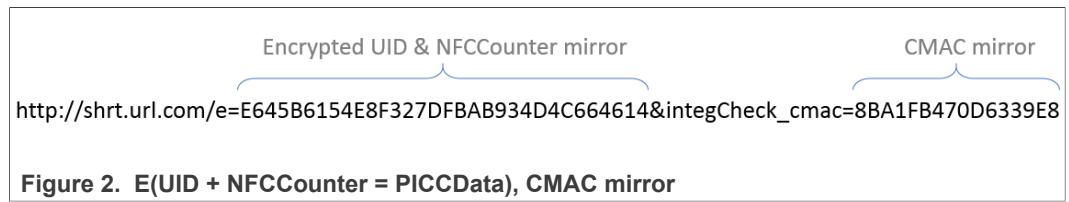

Figure 2. E(UID + NFCCounter = PICCData), CMAC mirror

Figure 3. E(PICCData), E(TagTamper status) and CMAC mirror

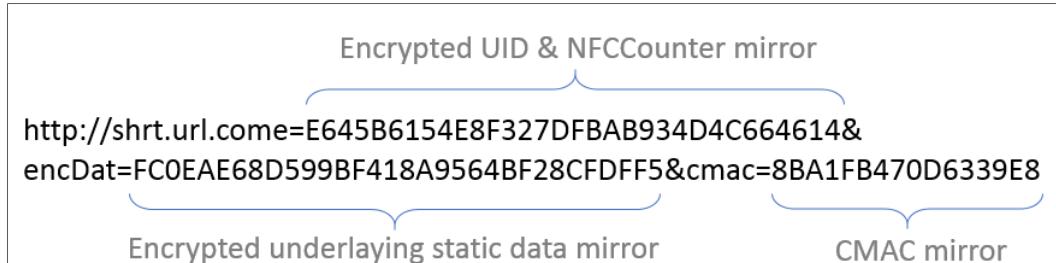

Figure 4. E(PICCData), E(Static File Data) and CMAC mirror

## 4.2 SUN generation procedure

For detailed NFC Activity procedure, refer to [10]. A high-level description of SUN generation:

1. On the non-locked Home screen, an NFC device (aka Reader/Writer) turns on NFC reader IC
2. NFC reader does the polling cycle for NFC technologies [Figure 5](#)
3. NTAG is tapped. During NFC field present, NTAG boots up
4. Reader/Writer does Tag detection, ISO-14443 anti-collision, device activation [10]
5. NTAG prepares all the mirrors (generates session keys, does encryption, does mirroring, CMAC etc.) which are configured
6. Reader/Writer reads the NDEF with ISOReadBinary command. NFC counter is increased by one (1), any subsequent read within the same session does not increase the counter

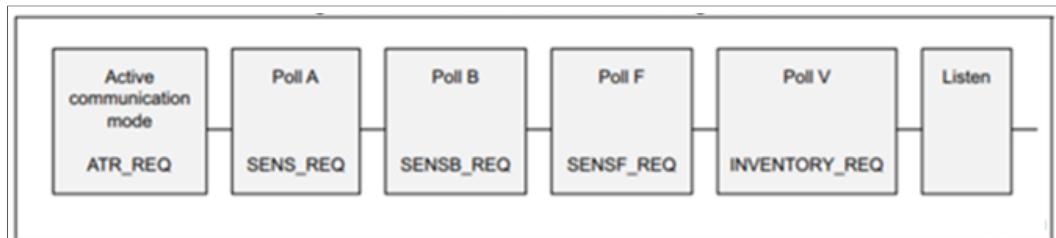

Figure 5. NFC Reader/Writer technology poll

### 4.3 SDM Session Key Generation

Pseudo random function as per CMAC algorithm according to NIST SP 800-38B [2]. These keys are used only for Secure Dynamic NDEF Messaging - SUN.

**Note:** These are not the same session keys as Secure Standard Messaging ones, which are generated during AuthenticateFirst or AuthenticateNonFirst [[Section 5.1](#)].

*Prerequisites:* CMAC with AES-128 cipher core

*Key used:* SDMFileReadKey

*Length [bytes]:* 16

*Algorithm:*

1.  $K_{\text{SesSDMFileReadENC}} = \text{MAC}(K_{\text{SDMFileRead}}; SV1)$
2.  $K_{\text{SesSDMFileReadMAC}} = \text{MAC}(K_{\text{SDMFileRead}}; SV2)$

*Output:*

1.  $K_{\text{SesSDMFileReadENC}}$
2.  $K_{\text{SesSDMFileReadMAC}}$

**Table 2. SDM Session Key Generation**

Step	Command	=	Data
1	Is UID mirrored?	=	If YES, it must be included in SV calculation
2	Is SDMReadCtr mirrored?	=	If YES, it must be included in SV calculation
3	UID	=	04C767F2066180
4	SDMReadCtr	=	010000 (LSB first as per [ <a href="#">Section 3.1</a> ])
5	$K_{\text{SDMFileRead}}$	=	5ACE7E50AB65D5D51FD5BF5A16B8205B
6	$SV1 = C33C\ 0001\ 0080\ [\text{UID}]$ [SDMReadCtr] [ZeroPadding] <sup>[1]</sup>	=	C33C0001008004C767F2066180010000
7	$SV2 = 3CC3\ 0001\ 0080\ [\text{UID}]$ [SDMReadCtr] [ZeroPadding]	=	3CC30001008004C767F2066180010000
8	$K_{\text{SesSDMFileReadENC}} = \text{MAC}(K_{\text{SDMFileRead}}; SV1)$	=	66DA61797E23DECA5D8ECA13BBADF7A9
9	$K_{\text{SesSDMFileReadMAC}} = \text{MAC}(K_{\text{SDMFileRead}}; SV2)$	=	3A3E8110E05311F7A3FCF0D969BF2B48

[1] In case of encrypting file data - PICCENCDATA, mirroring of UID and SDMReadCtr is mandatory. Therefore, both are always included in SV1 calculation.

### 4.4 SUN Mirroring

#### 4.4.1 PICCData mirror

PICCData consists of UID and SMDCounter. UID, SMDCounter and CMAC are always co-existing, meaning that by enabling/disabling PICCData mirror, all are mirrored or not. Their mirror offsets within NDEF can be individually chosen for UID and SMDCounter. CMAC shall be appended to the end of NDEF.

- Prerequisites:* • n/a
- Offset name:* • UIDOffset,  
• SDMReadCtrOffset,  
• CMACinputOffset
- Length [bytes]:* • UIDOffsetLength: 14,  
• SDMReadCtrOffsetLength: 6,  
• CMACOffsetLength: 16

*Example SUN mapping:*

<https://ntag.nxp.com/424?uid=04C767F2066180&ctr=000001&c=54A45B2C3A558765>

How to verify the CMAC of the SUN is described in chapter [[Section 4.4.4.2](#)] - different data is used for computation.

#### 4.4.2 PICCData Encrypted mirror

Note: With encryption of PICCData, we encrypt UID and NFCCounter. Therefore verification side does not have immediate info on UID, which is usually used as input for key derivation function. In this case,  $K_{SDMMetaRead}$  key shall not be UID diversified and high attention on secure storage on system level of this key is required.

##### 4.4.2.1 Encryption of PICCData

- Prerequisites:* SDMMetaReadKey set to App.KeyX (0x0 - 0x4)
- Offset name:* PICCENCDATAOffset
- Length [bytes]:* 32\*n; n=1,2,..., n
- Algorithm:*  $PICCENCDATA = E(K_{SDMMetaRead}; PICCDataTag [ || UID ] [ || SDMReadCtr ] [ || RandomPadding^{(1)} ] )$

*Example SUN mapping:*

<https://ntag.nxp.com/424?e=EF963FF7828658A599F3041510671E88&c=94EED9EE65337086>

(1) - Random padding generated by the PICC to make the input 16 bytes long. It is only relevant if SDMReadCtr is not mirrored, as SDMReadCtr adds uniqueness already.

##### 4.4.2.2 Decryption of PICCData

Verification side (e.g. backend, RF reader, NFC Mobile application, etc.) needs to know following parameters:

- Prerequisites:* SDMMetaReadKey used
- Offset name:* PICCENCDATAOffset in URL
- Length [bytes]:* PICCENCDATALength
- Algorithm:*  $PICCData = D(K_{SDMMetaRead}; PICCENCDATA)$

**Table 3. Decryption of PICCData**

Step	Command	=	Data Message
1	Encrypted PICCData	=	EF963FF7828658A599F3041510671E88
2	SDMMetaReadKey = App.Key0	=	00000000000000000000000000000000
3	D(K <sub>SDMMetaReadKey</sub> , PICCENCDData)	=	C704DE5F1EACC0403D0000DA5CF60941
4	PICCDataTag	=	C7
5	UID	=	04DE5F1EACC040
6	SDMReadCtr	=	3D0000
7	Random padding	=	DA5CF60941
8	PICCDataTag [bit]	=	1100 0111
9	PICCDataTag - UID mirroring [bit7]	=	1 (UID mirroring enabled)
10	PICCDataTag - SDMReadCtr mirroring [bit6]	=	1 (SDMReadCtr mirroring enabled)
11	PICCDataTag - UID Length [bit3-0]	=	111b = 7d (7 byte UID)

**Example for Python 2.7**

```
#! /usr/bin/env python -2
from binascii import hexlify, unhexlify
from Crypto.Cipher import AES

#
# PICCData decryption
# PICCData = AES-128_DECRYPT(KSDMMetaRead; PICCDataTag[||UID]
# [||SDMReadCtr]||RandomPadding)

IV = 16 * '\x00'
key = 16 * '\x00' # FileAR.SDMMetaRead Key

# Enc_PICC_Data = '\xEF\x96\x3F\xF7\x82\x86\x58\xA5\x99\xF3\x04\x15\x10\x67\x1E\x88'
Enc_PICC_Data = 'EF963FF7828658A599F3041510671E88'

myaes = AES.new(key, AES.MODE_CBC, IV=IV)
PICCData = myaes.decrypt(unhexlify(Enc_PICC_Data))

PICCDataTag = hexlify(PICCData[0:1])
UID = hexlify(PICCData[1:8])
SDMReadCtr = hexlify(PICCData[8:11])

print '\nDecrypted PICCData: ' + hexlify(PICCData)
print "PICCDataTag: " + PICCDataTag
print "UID : " + UID
print "SDMReadCtr : " + SDMReadCtr
```

**Returns:**

Decrypted PICCData: c704de5f1eacc0403d0000da5cf60941

PICCDataTag: c7

UID: 04de5f1eacc040

SDMReadCtr: 3d0000

#### 4.4.3 SDMENCFiledData mirror

The SDMMACInputOffset must ensure that complete SDMENCFiledData is included in the CMAC calculation (CMACInputOffset).

#### 4.4.3.1 Encryption of SDMENCFiledData

**Prerequisites:** SDMFileReadKey set to App.KeyX (0x0 - 0x4) → SesSDMFileReadENCKey derived from SDMFileReadKey using [Section 4.3](#)

*Offset name:* ENCOffset

*Length [bytes]:* 32

**Algorithm:** **SDMENCFiledData** = E( $K_{SesSDMFileReadENCKey}$ ; **StaticFileData** [SDMENCOFFSET :: SDMENCOFFSET + SDMENCLength/2 - 1])

*Example of underlying NDEF mapping (Read NDEF file in Authenticated state):*

### *Example of SUN mapping:*

[https://my424dna.com/?picc\\_data=FDE4AFA99B5C820A2C1BB0F1C792D0EB&enc=94592FDE69FA06E8E3B6CA686A22842B&cmac=C48B89C17A233B2C](https://my424dna.com/?picc_data=FDE4AFA99B5C820A2C1BB0F1C792D0EB&enc=94592FDE69FA06E8E3B6CA686A22842B&cmac=C48B89C17A233B2C)

#### 4.4.3.2 Decryption of SDMENCFFileData

Verification side (e.g. backend, RF reader, NFC Mobile application, etc.) needs to know following parameters:

**Prerequisites:**

- KSDMFileRead used
- SesSDMFileReadENCKey construction algorithm

*Offset name:* SDMENCFfileDataOffset in URL

*Length [bytes]:* SDMENCDDataLength

*Algorithm:*  $\text{PICCData} = \text{D}(\text{K}_{\text{SesSDMFileReadENCKey}}; \text{PICCENCDData})$

**Table 4. Decryption of PICCData**

**Table 4. Decryption of PICCData...continued**

#### 4.4.4 SDMMAC mirror

#### 4.4.4.1 SDMMAC

**Prerequisites:** SDMFileReadKey set to 0x0 - 0x4 in NDEF file settings.

*Offset name:* SDMMACOffset, SDMMACInputOffset

*Length [bytes]:* 16

**Algorithm:** **SDMMAC** = MAC<sub>T</sub>(K<sub>SesSDMFleReadMAC</sub>; DynamicFileData  
[ SDMMACInputOffset :: SDMMACOffset - 1 ] )<sup>(1)</sup>

*Example SUN mapping:*

<https://ntag.nxp.com/424?e=EF963FF7828658A599F3041510671E88&c=94EED9EE65337086>

(1) - DynamicFileData is the file data as how it is put on the external interface (mirrored) - replacing any placeholders by the dynamic data.

#### 4.4.4.2 SDMMAC calculation

#### 4.4.4.2.1 CMACInputOffset == CMACOffset

*Prerequisites:* SDMFileReadKey  
*Offset name:* SDMMACOffset (SDMMACInputOffset == SDMMACOffset)  
*Length [bytes]:* 16  
*Algorithm:* SDMMAC = MACt( $K_{SesSDMFileReadMAC}$ ; zero length input)

**Table 5. CMAC calculation when CMACInputOffset == CMACOffset**

Step	Command	=	Data Message
1	Key <sub>SDMFileReadMAC</sub>	=	00000000000000000000000000000000
2	PICCENCDATA	=	EF963FF7828658A599F3041510671E88
3	D( $K_{SDMFileReadMAC}$ , PICCENCDATA)	=	C704DE5F1EACC0403D0000DA5CF60941
4	PICCDATAG	=	C7
5	UID	=	04DE5F1EACC040
6	SDMReadCtr	=	3D0000
7	Random padding	=	DA5CF60941
8	PICCDATAG [bit]	=	1100 0111
9	PICCDATAG - UID mirroring [bit7]	=	1 (UID mirroring enabled)
10	PICCDATAG - SDMReadCtr mirroring [bit6]	=	1 (SDMReadCtr mirroring enabled)
11	PICCDATAG - UID Length [bit3-0]	=	111b = 7d (7 byte UID)
<b>Session Key generation</b>			
12	SV2 = 3CC3 0001 0080 [UID] [SDMReadCtr] [ZeroPadding]	=	3CC30001008004DE5F1EACC0403D0000
13	$K_{SesSDMFileReadMAC} = MAC(K_{SDMFileReadMAC}; SV2)$	=	3FB5F6E3A807A03D5E3570ACE393776F
14	SDMMAC = MACt( $K_{SesSDMFileReadMAC}$ ; zero length input)	=	94EED9EE65337086

Example for Java, using Bouncy Castle library:

```
package MFCMAC;

import org.bouncycastle.crypto.BlockCipher;
import org.bouncycastle.crypto.Mac;
import org.bouncycastle.crypto.engines.AESFastEngine;
import org.bouncycastle.crypto.macs.CMac;
import org.bouncycastle.crypto.params.KeyParameter;

public class MFCMAC {

    public byte[] calculateMFCMAC(byte[] key, byte[] valueToMAC) {

        try {

```

```

        int cmacSize = 16;
        BlockCipher cipher = new AESFastEngine();
        Mac cmac = new CMac(cipher, cmacSize * 8);
        KeyParameter keyParameter = new KeyParameter(key);
        cmac.init(keyParameter);
        cmac.update(valueToMAC, 0, valueToMAC.length);
        byte[] CMAC = new byte[cmacSize];
        cmac.doFinal(CMAC, 0);

        byte[] MFCMAC = new byte[cmacSize / 2];

        int j = 0;
        for (int i = 0; i < CMAC.length; i++) {
            if (i % 2 != 0) {
                MFCMAC[j] = CMAC[i];
                j += 1;
            }
        }

        return MFCMAC;

    } catch (Exception ex) {
        ex.printStackTrace();
    }

    return null;
}
}

```

Modern libraries have "zero length" MAC-ing implemented. In case of manual implementation, below reference pseudo-code may be used. CMAC in detailed steps as per NIST Special Publication 800-38B [2].

```

## 5 Standard Secure Messaging (SSM)

Standard Secure messaging is the most up-to-date secure messaging mode, with following properties:

- plain/maced/encrypted channel of communication established between PCD and PICC

Table 7. Communication modes in SSM

Communication Mode	Bit Representation	Explanation
CommMode.Plain	X0	<b>Plain</b> communication: No encryption is used at all.
CommMode.MAC	01	<b>MACed</b> communication: The data is transferred in plain, but a 4 bytes or 8 bytes MAC is added to the message.
CommMode.Full	11	<b>Encrypted</b> communication: Full protection for integrity, authenticity, and confidentiality.

- Confidentiality and integrity are protected by using two session keys (generated on both sides - PCD and PICC)
- Standard Secure messaging is established by successful Cmd.AuthenticateEV2First and Cmd.AuthenticateEV2NonFirst - allows cryptographically binding of all messages within one transaction by using a transaction identifier (TI) and a command counter (CmdCtr)
- For an Authorized changes (settings, data)

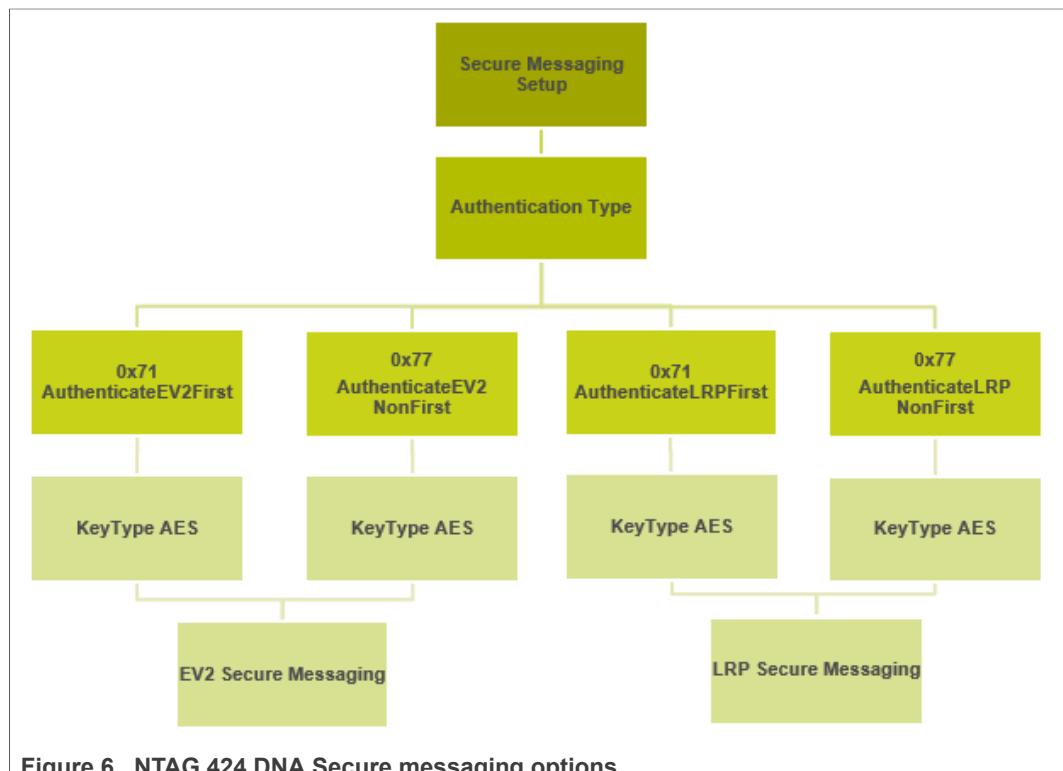

Figure 6. NTAG 424 DNA Secure messaging options

The LRP mode can be permanently enabled using the SetConfiguration command. After this switch, it is not possible to revert to AES mode. More details on LRP can be found in [11] and [12].

## 5.1 SSM Session Keys generation

As a result of successful authentication, KSesSDMFileReadMAC and KSesSDMFileReadENC keys are generated on PCD and PICC sides, using the same algorithm.

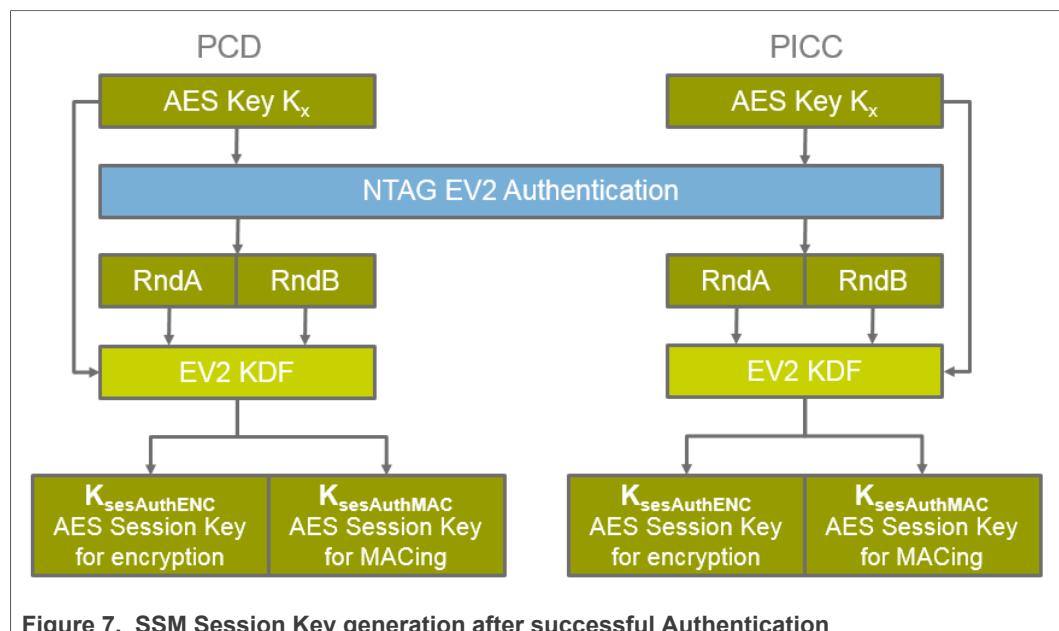

Figure 7. SSM Session Key generation after successful Authentication

## 5.2 CommMode.Plain

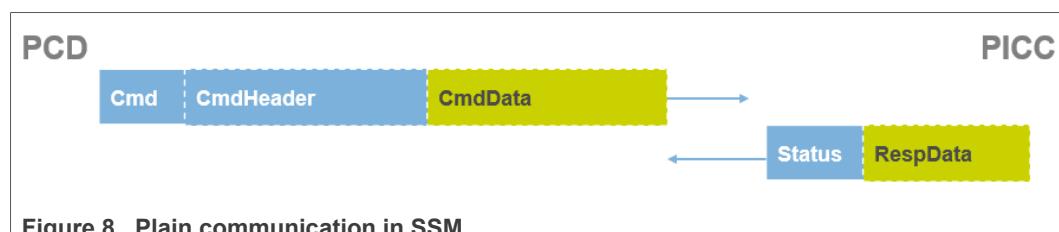

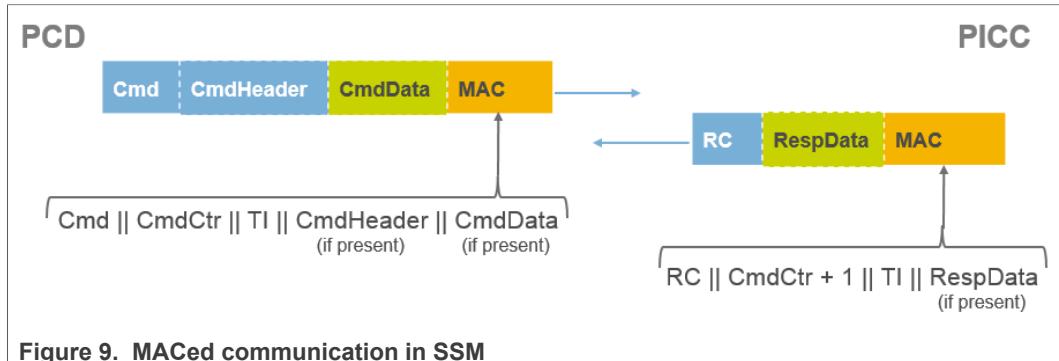

Figure 8. Plain communication in SSM

### 5.3 CommMode.MAC

PCD MAC calculated as:

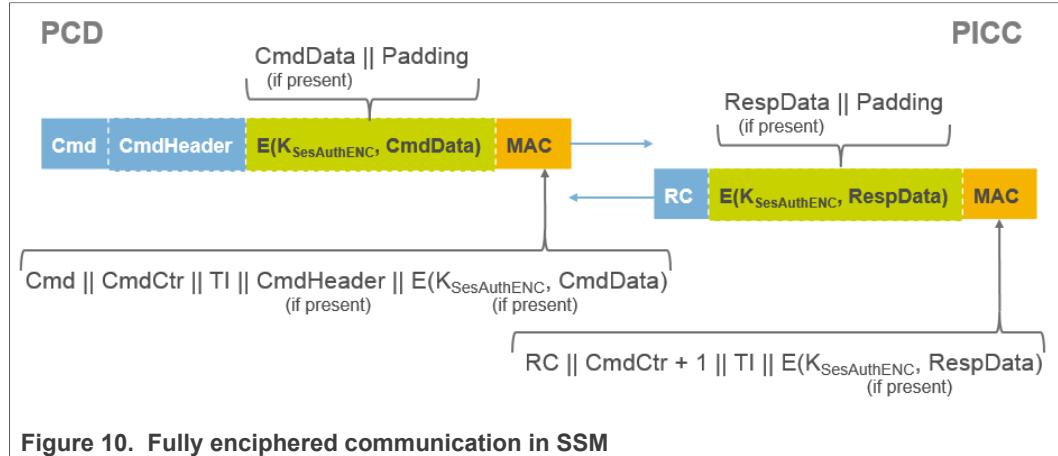

$\text{CMAC} = \text{MACT} ( K_{\text{SesAuthMAC}}, \text{IV}, \text{Cmd} \parallel \text{CmdCtr} \parallel \text{TI} \parallel \text{CmdHeader (if present)} \parallel \text{EncCmdData (if present)} )$ .

In following example, session keys  $K_{\text{SesAuthENC}}$  and  $K_{\text{SesAuthMAC}}$  were generated during some random AuthenticateEV2First procedure.

**Table 8. Example of CommMode.MAC on Cmd.GetFileSettings command**

Step	Command	Data Message
1	$K_{\text{SesAuthMAC}}$	= 8248134A386E86EB7FAF54A52E536CB6
2	Cmd	= F5
3	CmdHeader	= 02
4	CmdData	= n/a
5	TI	= 7A21085E
6	CmdCounter	= 0000
7	$\text{Cmd} \parallel \text{CmdCounter} \parallel \text{TI} \parallel \text{CmdHeader} \parallel \text{n/a}$	= F500007A21085E02
8	$\text{CMAC} = \text{MACT} ( K_{\text{SesAuthMAC}}, \text{Cmd} \parallel \text{CmdCounter} \parallel \text{TI} \parallel \text{CmdHeader} \parallel \text{n/a} )$	= B565AC978FA46D5784C845CD1444102C
9	MACT	= 6597A457C8CD442C
10	Cmd.GetFileSettings C-APDU	> 90F5000009026597A457C8CD442C00

14	CMAC = MFCMAC( $K_{SesAuthMAC}$ , Load) (truncated to 8 Bytes)	= DDDDB9EC959B3EFEB
15	PCD compares CMACs	= DDDDB9EC959B3EFEB == DDDDB9EC959B3EFEB

## 6 Personalization example

Following steps are optional and used as an example only. Final steps shall be defined and configured by customer needs.

Example configuration:

- NDEF content with placeholders: [https://choose.url.com/ntag424?  
e=00000000000000000000000000000000&c=000000000000000000000000](https://choose.url.com/ntag424?e=00000000000000000000000000000000&c=000000000000000000000000)
- mirroring of PICCdata encrypted (ENCPICCData)
  - Encryption key ( $K_{SDMMetaRead}$ ): 0x02
  - ENCPICCDataOffset: 0x20
- CMAC computation:
  - CMAC-ing key ( $K_{SDMFileRead}$ ) which is used to generate session key  
 $K_{SesSDMFileReadMAC}$ : 0x01
  - SDMMACOffset: 0x43
- empty payload for CMAC input (SDMMACInputOffset == SDMMACOffset)
- GetCounterValue command protected by key 0x01
- No NFCCounter limit
- no mirroring and no encryption of SDMFileData - SDMENCFileData

Steps:

1. ISO14443-4 PICC Activation [[Section 6.1](#)]
2. Originality signature verification [[Section 6.2](#)]
3. ISO SELECT NDEF application using DF Name [[Section 6.3](#)]
4. Get File Settings [[Section 6.4](#)]
5. GetVersion [[Section 6.5](#)]
6. AuthenticateFirst with ApplicationKey 0x00 [[Section 6.6](#)]
7. Prepare NDEF data [[Section 6.7](#)]
8. Write data to 0xE104 (NDEF File) [[Section 6.8](#)]
9. Change File Settings of 0xE104 [[Section 6.9](#)]
10. AuthenticateEV2First with ApplicationKey 0x03 [[Section 6.10](#)]
11. ISO SELECT Proprietary File 0xE105 [[Section 6.11](#)]
12. Write data to 0xE105 (Proprietary File) [[Section 6.12](#)]
13. ISO SELECT Capability Container file 0xE103 [[Section 6.13](#)]
14. AuthenticateAESNonFirst with ApplicationKey 0x00 [[Section 6.14](#)]
15. Write data to 0xE103 (CC file) - READ-ONLY [[Section 6.15](#)]
16. Change Key - ApplicationKey 0x02 (Using AES-128 Key diversification) [[Section 6.16.1](#)]
17. Change Key - ApplicationKey 0x00 (Master Key) [[Section 6.16.2](#)]

### 6.1 ISO14443-4 PICC Activation

Reader supporting ISO14443-4 or NFC is required.

Table 10. ISO14443-4 PICC Activation

Step	ISO 14443 Command	NFC Forum Command	=	Data Message
1	RF field ON		=	true

**Table 10. ISO14443-4 PICC Activation...continued**

Step	ISO 14443 Command	NFC Forum Command		Data Message
2	REQA	SENS_REQ	>	26

12	RATS	RATS	>	E080
13	ATS		<	067777610280
14	PPS	ISO-DEP	>	D01100 <sup>(1)</sup>
15	PPSS		<	D0

(1) Higher data transfer can be set in this step (downlink and uplink). Example shown in

## 6.2 Originality signature verification

The Symmetric Originality Check is possible only in LRP mode. The asymmetric check can be done prior personalization to assure that it will be done on the NXP delivered IC.

Procedure is described in [[Section 8.2](#)].

## 6.3 ISO SELECT NDEF application using DF Name

**Table 11. Select NDEF Application using Cmd.ISOSelect**

Step	Command		Data Message
1	ISO7816 AID – DF Application Name	=	D2760000850101
2	CLA	=	00
3	INS	=	A4
4	P1	=	04 (select by DF name)
5	P2	=	0C
6	Lc	=	07
7	Command header	=	00A4040C07
8	Command data (ISO7816 AID – DF Name)	=	D2760000850101
9	Le	=	00
10	Cmd.Select C-APDU	>	00A4040C07D276000085010100

**Table 11.** Select NDEF Application using Cmd.ISOSelect...*continued*

Step	Command	Data Message	
11	R-APDU	<	9000

## 6.4 Get File Settings

This step does not reflect default delivered NTAG 424 DNA configuration of NDEF file settings (0000E0EE00010026000CA). Purpose of the example is to show meaning of bytes in response APDU.

Step is optional and may be left out. It is just to identify CommMode: Plain, MACed or FULL and adopt secure messaging of commands in later steps.

**Table 12.** Get file settings of NDEF File

Step	Command	Data Message	
1	Cmd	=	F5
2	Command header	=	02 (file nr. 02)
3	Command data (ISO7816 AID – DF Name)	=	n/a
4	C-APDU = CLA + INS + P1 + P2 + Lc + (CmdHdr + CmdData) + Le	>	90F50000010200
5	R-APDU	<	004300E0000100C1F1212000004300009100

Meaning of R-APDU:

	Length [bytes]	Value	Meaning
FileType	1	00	FileType.StandardData
FileOption	1	40	SDM and Mirror enabled, CommMode.Plain
AccessRights	2	00E0	<ul style="list-style-type: none"> <li>• FileAR.ReadWrite = 0 (key nr. 0)</li> <li>• FileAR.Change = 0</li> <li>• FileAR.Read = E (free)</li> <li>• FileAR.Write = 0</li> </ul>
FileSize	3	000100	256d
SDMOptions	1	C1	UID mirror set, SDMReadCounter set, ASCII Encoding mode enabled

SDMAccessRights	2	F121	<ul style="list-style-type: none"> <li>RFU = F</li> <li>FileAR.SDMCtrRet = 1 (key nr. 1)</li> <li>FileAR.SDMMetaRead (PICCENData) = 2</li> <li>FileAR.SDMFileRead (CMAC) = 1</li> </ul>
UIDOffset	3	200000 (n/a by default)	32d
SDMReadCtr Offset	3	430000 (n/a by default)	67d
SDMMACInputOffset	3	n/a	
PICCDataOffset	3	n/a	
SDMMACInputOffset	3	n/a	
SDMENCOffset	3	n/a	
SDMENCLength	3	n/a	
SDMMACOffset	3	n/a	
SDMReadCtrLimit	3	n/a	

## 6.5 Get Version

Table 13. Get Version

Step	Command		Data Message
1	Cmd	=	60
2	Command header	=	n/a
3	Command data (ISO7816 AID – DF Name)	=	n/a
4	C-APDU = CLA + INS + P1 + P2 + Lc + (CmdHdr + CmdData) + Le	>	9060000000
5	R-APDU	<	0404083000110591AF
6	C-APDU = CLA + INS + P1 + P2 + Lc + (CmdHdr + CmdData) + Le	>	90AF000000
7	R-APDU	<	0404020101110591AF
8	C-APDU = CLA + INS + P1 + P2 + Lc + (CmdHdr + CmdData) + Le	>	90AF000000
9	R-APDU	<	04968CAA5C5E80CD65935D4021189100

## NTAG 424 DNA and NTAG 424 DNA Tag Tamper features and hints

Meaning of R-APDU as per [[Data sheet](#)]:

	Length [bytes]	Value	Meaning
Vendor ID	1	04	NXP Semiconductors
Type	1	04	NTAG
Sub-Type	1	08	50 pF, Strong back modulation enabled
Major Version	1	30	HW major version number
Minor Version	1	00	HW minor version number
Storage Size	1	11	256 B < storage size < 512 B
Communication Protocol Type	1	05	ISO/IEC 14443-4 support
Software Information			
Vendor ID	1	04	
Type	1	04	
Sub-Type	1	02	
Major Version	1	01	
Minor Version	1	01	
Storage Size	1	11	
Communication Protocol Type	1	05	
Unique Serial Number	7	04968CAA5C5E80	UID if not configured for RandomID
Production Batch Number	4	CD65935D	Production batch number
BatchNo/FabKey	1	40	
Calendar week of Production	1	21	Calendar week of production
Year of production	1	18	Year of production
FabKey ID			

## 6.6 AuthenticateEV2First with key 0x00

## 6.7 Prepare NDEF message

**Table 15. NDEF Message Creation**

### 6.7.1 NDEF

NDEF is NFC Forum defined data exchange format. The NDEF specification defines a message encapsulation format to exchange information between an NFC forum device and another NFC forum device or an NFC forum Tag. NDEF is a lightweight, binary message format that can be used to encapsulate one or more application-defined payloads of arbitrary type and size into a single construct called NDEF message.

An application-defined payload is encapsulated inside one single NDEF record, or chunked into two or more NDEF records.

One or more application-defined payloads contains the data: vCard, URL etc.

### 6.7.2 NDEF Length

Size: 2-Byte

[Len] = “Header for URI record” length + NDEF message length.

In this example:  $0x005E = 94d$  Bytes (Header for URI record" length – 5d Bytes + NDEF message length – 89d Bytes)

### 6.7.3 NDEF Length and header

#### 6.7.4 Prepare NDEF message

**Table 16. NDEF Message Creation**

## 6.8 Write NDEF file

Writing of the data to the NDEF file may be performed either by Update Binary (Cmd.UpdateBinary) or Write Data (Cmd.WriteData ) commands.

### 6.8.1 Write NDEF File - using Cmd.ISOUpdateBinary, CommMode.PLAIN

**Table 17. Write NDEF File - using Cmd.ISOUpdateBinary**

Step	Command	=	Data Message
1	CLA	=	00
2	INS	=	D6
3	P1	=	00
4	P2	=	00
5	Lc	=	53
6	Data	=	0051D1014D550463686F6F73652E75726C2E636 F6D2F6E7461673432343F653D3030303030303030 30 303030303026633D30303030303030303030303030 30303030

8	C-APDU	>	00D60000530051D1014D550463686F6F73652E7 5726C2E636F6D2F6E7461673432343F653D3030 30 3030303030303030303026633D30303030303030 30303030303030303000
9	R-APDU	<	9000

### **6.8.2 Write NDEF File - using Cmd.WriteData, CommMode.FULL**

Usually there is no need to write NDEF data over encrypted channel, as NDEF File contains end consumer readable data. This chapter is for demonstrating encrypted data channel exchange - CommMode.FULL.

**Table 18. Write NDEF File - using Cmd.WriteData**

**Table 18. Write NDEF File - using Cmd.WriteData...continued**

## 6.15 Write to CC - using Cmd.WriteData, CommMode.PLAIN

This step is needed to switch the lifecycle from INITIALISED to READ-ONLY as per NFC Forum T4T spec.

**Table 25. Write CC File (0xE103) - using Cmd.WriteData**

## 6.16 Changing the Key

Only changing of keys nr. 0x2 and 0x0 are shown in the following step. It is highly recommended to configure all the Application Keys during personalization procedure.

#### 6.16.1 KeyNo to be changed does not equal AuthKey

Case 1: Key number to be changed  $\neq$  Key number for currently authenticated session

KeyNo 0x02 will be changed, while currently authenticated with KeyNo 0x00. AES-128 Master Key key diversification is used in the following example. Keys can be diversified using NXP suggested diversification method described in [13].

**Table 26. Example for Cmd.ChangeKey in Secure Messaging using Case 1**

## 7 Special functionalities

### 7.1 Configuration of NDEF application and PICC attributes

Special command: SetConfiguration

Authentication with key AppMasterKey is needed

CommMode.Full needed

It is possible to configure:

- Enable RandomID
- Disable chaining with WriteData
- Enable LRP mode (irreversible)
- Failed authentication counter configuration
- Enable Strong back modulation

### 7.2 Random ID - RID

This feature is used to retain end consumer privacy, avoid tracking and to meet latest GDPR regulations. In the combination with PICCData encryption, the real NTAG 424's UID cannot be revealed, the PICC responds with random ID (4 bytes) during ISO14443-3 anticollision.

Note:

- If Random ID feature is enabled, the ATQA value is changed to 0x0304 (default is 0x0344).
- Enabling Random ID feature is irreversible process - meaning that it cannot be disabled once it is enabled.

*Prerequisites:* Active Authentication with the AppMasterKey (AppKey00)

*CommMode:* FULL

**Table 28. Enabling Random ID - RID**

Step	Command	=	Data
1	Cmd	=	5C
2	K <sub>SesAuthMAC</sub>	=	FE4EDBF46536557E304682F33E63A84F

***Result:***

Tap1 (POR, REQA, ISO14443-3 anticollision CL 1): UID = 08F84941

Tap2 (POR, REQA, ISO14443-3 anticollision CL 1): UID = 08B0ADD0

Tap3 (POR, REQA, ISO14443-3 anticollision CL 1): UID = 08BFD57C

**7.3 Get UID**

With enabled feature of Random ID the only way to retrieve "real" NTAG 424 DNA's UID is to send Cmd.GetCardUID in CommMode.Full.

**Prerequisites:** Active Authentication with any application key

**CommMode:** FULL

**Table 29. Get NTAG 424 DNA's UID**

#### 7.4 Failed Authentications Counter

This feature improves countermeasures for potential side channel attacks, especially in AES mode. In LRP mode, side channel attack resistance is done by protocol itself, but it can be enabled for LRP mode as well.

Note: Originality keys do not support the failed authentication counter feature. Anyhow Orig.keys (LRP) have SCA resistance by protocol itself.

Every KeyID.AppKeys has its own instance of counter set:

- TotFailCtr (2 bytes)
  - Increases by 1 on each unsuccessful authentication
  - Decreases by value defined with TotFailCtrDecr
  - when TotFailCtrLimit is reached, related key cannot be used for Authentication anymore
- SeqFailCtr (1 byte)
  - Increases by 1 on each consecutive failed authentication
  - If value 50d reached, subsequent authentication attempts are delayed - gradually on all next 50d. Until 255d.
  - successful Authentication resets counter to 0
- SpentTimeCtr (2 bytes)
  - Counts the time "spent" after defined FWT, caused by delayed response of Failed Authentications Counter feature
  - Increased by SpentTimeUnit, which depends on FWT

Default values of counter sets:

- TotFailCtr: 0d
- TotFailCtrLimit: 1000d
- TotFailCtrDecr: 10d
- SeqFailCtr: 0d
- SpentTimeCtr: 0d

When changing an KeyID.AppKey with Cmd.ChangeKey, the related instance set of these three counters is reset to their default values at delivery.

Each failed authentication will increase targeted Key's counter of TotFailCtr by 1. On a successful Authentication, TotFailCtr it is decreased by TotFailCtrDecr value (default 10), to cope with false - positives. By default after 50 consecutive failed authentication attempts NTAG 424 DNA starts to introduce a delay into its response (SW code response of 91AD).

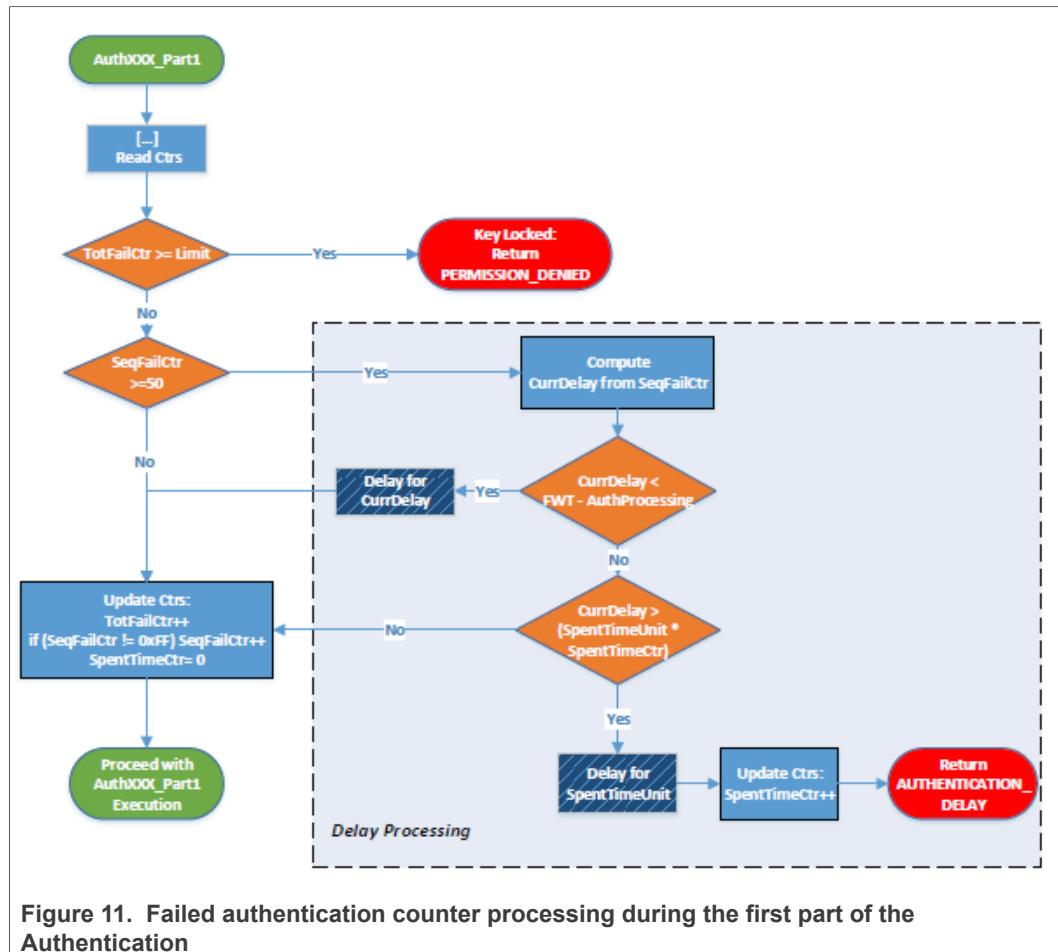

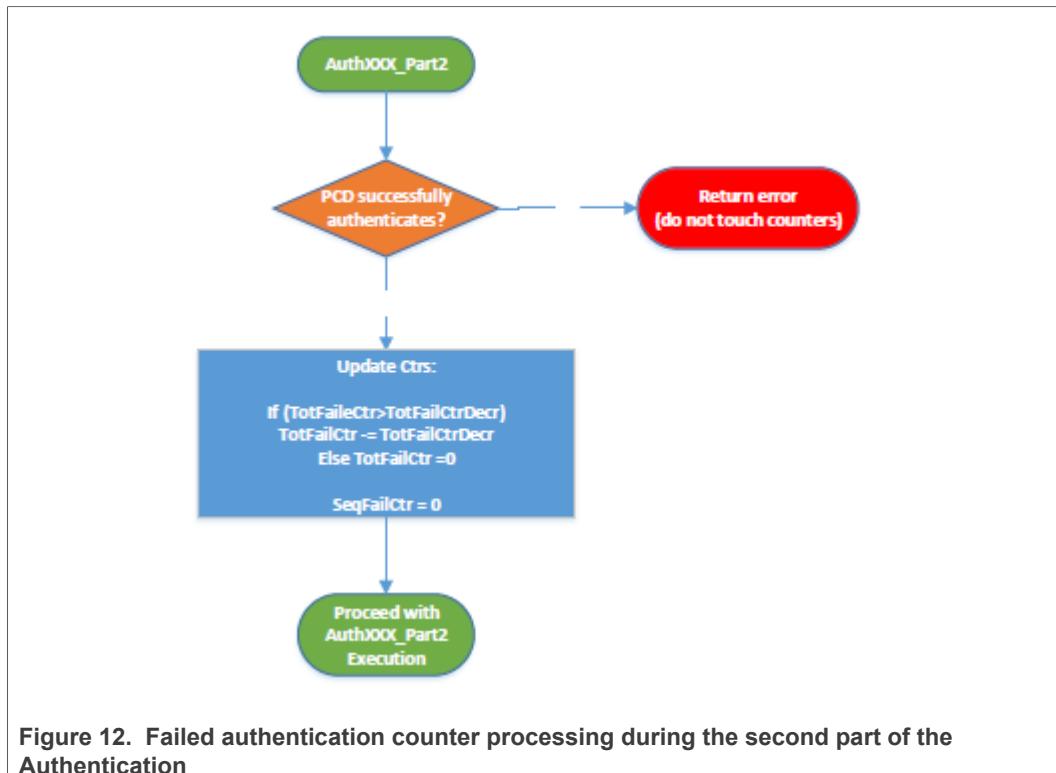

Figure 11. Failed authentication counter processing during the first part of the Authentication

## 7.5 TagTamper

NTAG 424 DNA TagTamper offers an NFC Forum-compliant solution to reflect, if the sealing of a product is opened. This works without a dedicated app on the NFC reader/writer device. It only requires the capability of reading out NFC Forum Type 4 Tag [5]. NTAG 424 DNA TagTamper has four pads. Two pads are used for antenna connection and the other two used to connect a detection wire. At start-up, the IC checks that the tag tamper wire. If opened, this will be recorded as permanent status in NVM (TTPermStatus). The result can be mirrored in the NDEF message.

Measurement is done automatically during the boot-up of the NTAG 424 NDA. It will be only done during processing of the first ISO/IEC 14443-4 command after complete activation, if the current TTPermStatus is still set to Close. It does not have any influence on any ISO standard time constraints. If PICC detects open tamper loop, TTPermStatus is updated. Measurement on the boot will not be triggered anymore.

In addition, a specific command (Cmd.GetTTStatus) triggers tamper loop measurement and the Tag returns both the permanent (TTPermStatus) and current status (TTCurrStatus) of the tamper loop connection. NTAG 424 DNA is a passive tag powered by an RF field, therefore it cannot trigger measurement by itself. Physical design of a final tag application with counter measures should be used to mitigate fraudulent use - as opening and fixing the tamper loop / seal in between measurements.

## 7.6 SDMReadCtr Limit

The SDMReadCtrLimit can be enabled by setting a customized value with Cmd.ChangeFileSettings. It can be retrieved with Cmd.GetFileSettings. This way reading of the NDEF file can be limited after SDMReadCtr reaches SDMReadCtrLimit. When SDMReadCtrLimit is reached, no reading with Cmd.ReadData or Cmd.ISOReadBinary can be executed. This feature can be a potential risk for DoS attacks.

Main use cases:

- To limit usage/tap number of a single PICC
- To limit conditions for Secure Dynamic Messaging side channel attacks

Feature can be disabled by Cmd.ChangeFileSettings, or by setting the SDMReadCtrLimit value to FFFFFF.

## 8 Originality Signature Verification

### 8.1 Symmetric check

Four (4) secret originality keys (also named as PICC Keys) are present on each individual NTAG 424 DNA, type of AES-128:

- Are written on the IC at the production in the NXP factory
- Keys are created in NXP Fabs HSM and never leave secure environment
- Cannot be changed after the IC leaves the NXP factory
- Originality Check is done by executing a successful LRP Authentication (not AES!) with one of the Originality keys. LRP mode needs to be enabled with command Cmd.SetConfiguration.
- These keys are shared only towards NXP's licensees  
Sharing procedure of these keys is written in the data sheet [\[1\]](#).

### 8.2 Asymmetric check

NTAG 424 DNA contains the NXP Originality Signature:

- It is computed according to Elliptic Curve DSA (ECDSA) based on the UID
- Key pair created in NXP Fabs HSM. Private key stored in high secure HSM in NXP premises
- Signature is 56 bytes long and according to SEC standard the **secp224r1** curve is taken

Asymmetric procedure consists of:

- retrieve Originality Signature (56 bytes) from the PICC with Cmd.Read\_Sig command (NTAG 424 needs to be in ISO14443 - Layer 4 level).
- public key is required by the verifier - available for public below
- ECDSA signature verifying operation needs to be applied - procedure and sample code (C#, Java, C) can be found in Application Note [\[9\]](#)

NTAG public key:

**048A9B380AF2EE1B98DC417FECC263F8449C7625CECE82D9B916C992DA209D68**

**422B81EC20B65A66B5102A61596AF3379200599316A00A1410**

**04** = IETF protocols use the [\[SEC1\]](#) representation of a point on an elliptic curve, which is a sequence of the following fields:

SEC1 point representation	
Field	Description
B0	{02, 03, 04}, where 02 or 03 represent a compressed point (x only), while 04 represents a complete point (x,y)
X	x coordinate of a point
Y	y coordinate of a point, optional (present only for B0=04)

## 9 System implementation concepts

Most common system used with NTAG 424 DNA is pictured below.

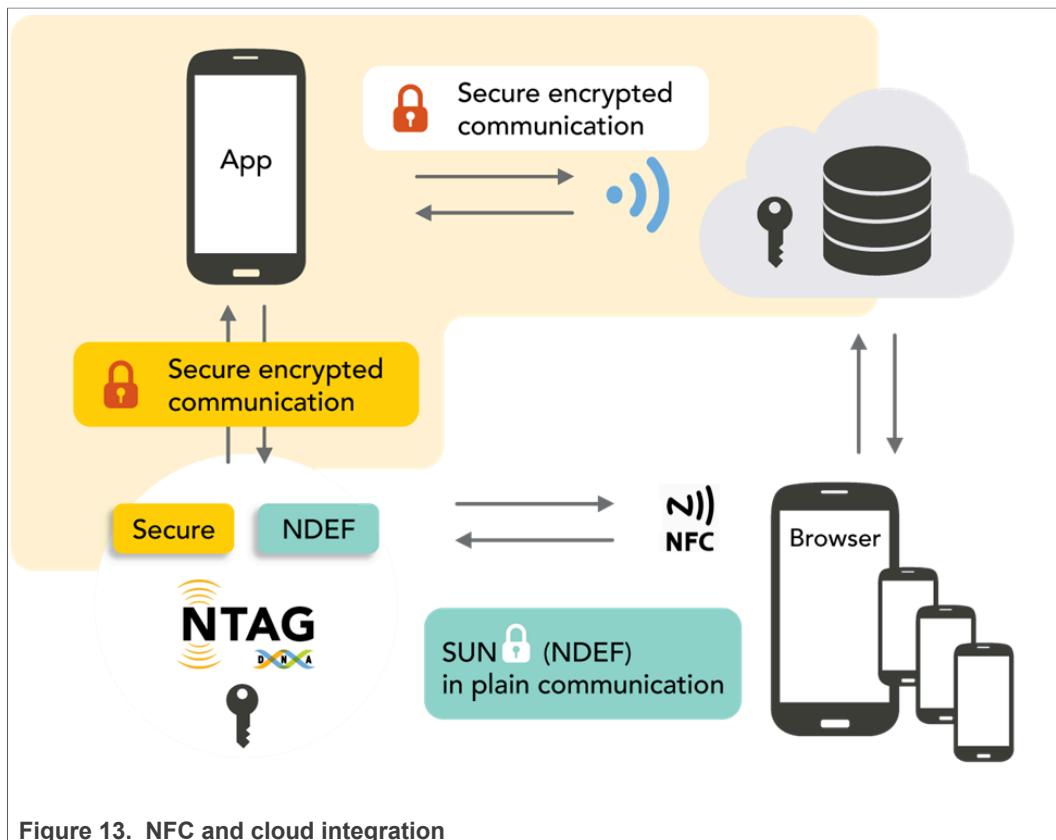

Figure 13. NFC and cloud integration

### 9.1 Online system

This kind of system is possible with NFC device broadband connectivity (data transfer) and robust backend system - usually cloud based service. By this approach, no keys need to be stored on NFC device, thus no secure element is used on NFC device. It is used only for relaying messages between cloud and the NTAG. It is advisable that all the keys (or master key) are securely stored on backend's HSM.

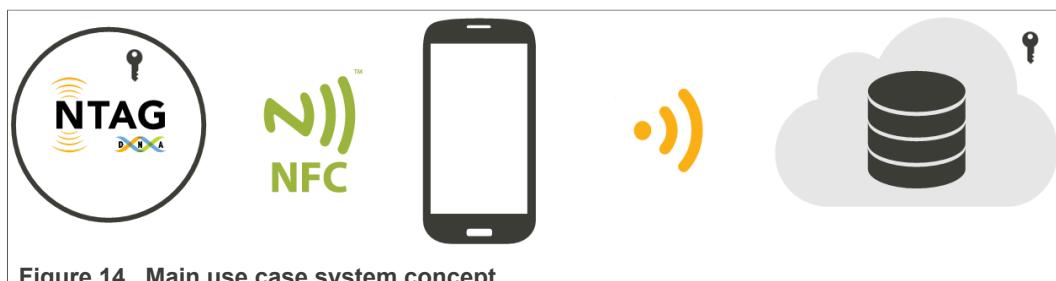

Figure 14. Main use case system concept

## 9.2 Offline system

Offline systems usually target closed loop, offline authentication applications. Application provides a proof of authenticity of the Tag or the product to which the Tag is applied to.

For optimal secure solution, host side needs to have:

- AES-128 or LRP crypto algorithm implemented
- secure key storage (e.g. Secure element)

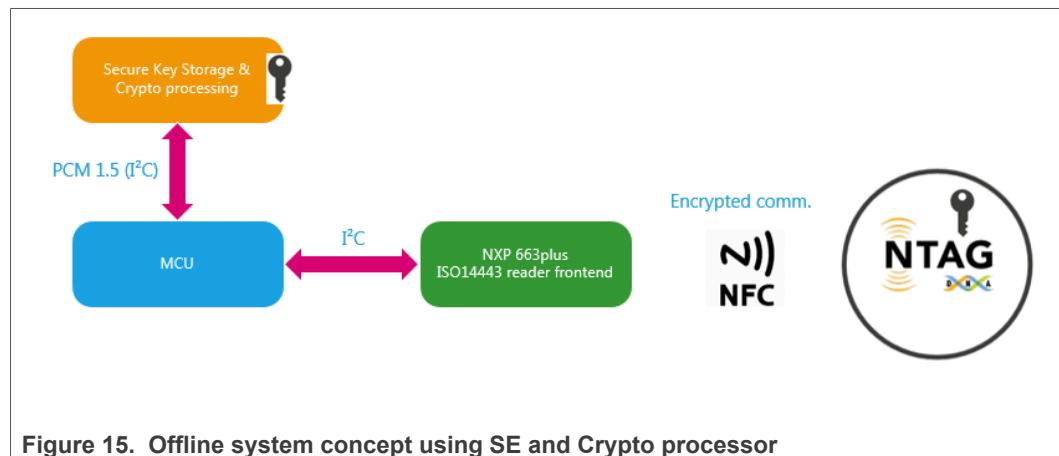

Figure 15. Offline system concept using SE and Crypto processor

## 10 Supporting tools

### 10.1 Software

Name	Description	Source
RFIDDiscover 4.5.1.8	PC software tool to evaluate NTAG 424 DNA PICC	NXP DocStore
NXPRdLib	C# API for developing Windows-based applications	NXP DocStore
TapLinX	Java-based SDK for developing Android applications, supporting all NXP RFID products, also NTAG 424 DNA	<a href="https://www.mifare.net/">https://www.mifare.net/</a>
TagInfo	Android and iOS based application to get detailed info of tapped NXP RFID products	Google PlayStore, Apple AppStore
TagWriter	Android application to configure, write NDEF data to NXP RFID products	Google PlayStore

## 12 Legal information

### 12.1 Definitions

**Draft** — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

### 12.2 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors. In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory. Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use** — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products. NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Evaluation products** — This product is provided on an "as is" and "with all faults" basis for evaluation purposes only. NXP Semiconductors, its affiliates and their suppliers expressly disclaim all warranties, whether express, implied or statutory, including but not limited to the implied warranties of non-infringement, merchantability and fitness for a particular purpose. The entire risk as to the quality, or arising out of the use or performance, of this product remains with customer. In no event shall NXP Semiconductors, its affiliates or their suppliers be liable to customer for any special, indirect, consequential, punitive or incidental damages (including without limitation damages for loss of business, business interruption, loss of use, loss of data or information, and the like) arising out the use of or inability to use the product, whether or not based on tort (including negligence), strict liability, breach of contract, breach of warranty or any other theory, even if advised of the possibility of such damages. Notwithstanding any damages that customer might incur for any reason whatsoever (including without limitation, all damages referenced above and all direct or general damages), the entire liability of NXP Semiconductors, its affiliates and their suppliers and customer's exclusive remedy for all of the foregoing shall be limited to actual damages incurred by customer based on reasonable reliance up to the greater of the amount actually paid by customer for the product or five dollars (US\$5.00). The foregoing limitations, exclusions and disclaimers shall apply to the maximum extent permitted by applicable law, even if any remedy fails of its essential purpose.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

**Security** — Customer understands that all NXP products may be subject to unidentified or documented vulnerabilities. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately. Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP. NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

### 12.3 Licenses

#### Purchase of NXP ICs with NFC technology

Purchase of an NXP Semiconductors IC that complies with one of the Near Field Communication (NFC) standards ISO/IEC 18092 and ISO/IEC 21481 does not convey an implied license under any patent right infringed by implementation of any of those standards. Purchase of NXP Semiconductors IC does not include a license to any NXP patent (or other IP right) covering combinations of those products with other products, whether hardware or software.

### 12.4 Trademarks

Notice: All referenced brands, product names, service names and trademarks are the property of their respective owners.

**NTAG** — is a trademark of NXP B.V.

## Tables

Tab. 1.	Abbreviations .....	3	Tab. 18.	Write NDEF File - using Cmd.WriteData .....	32
Tab. 2.	SDM Session Key Generation .....	10	Tab. 19.	Change NDEF file settings using Cmd.ChangeFileSettings .....	34
Tab. 3.	Decryption of PICCData .....	12	Tab. 20.	Cmd.AuthenticateEV2First using Key No 0x03 .....	35
Tab. 4.	Decryption of PICCData .....	13	Tab. 21.	Select Proprietary Application using Cmd.ISOSelectFile .....	36
Tab. 5.	C MAC calculation when CMACInputOffset == CMACOffset .....	15	Tab. 22.	Write Proprietary File (0xE105) - using Cmd.WriteData .....	37
Tab. 6.	C MAC calculation when CMACInputOffset ! = CMACOffset .....	17	Tab. 23.	Select NDEF Application using Cmd.Select ....	38
Tab. 7.	Communication modes in SSM .....	19	Tab. 24.	Cmd.AuthenticateEV2NonFirst using Key No 0x00 .....	39
Tab. 8.	Example of CommMode.MAC on Cmd.GetFileSettings command .....	21	Tab. 25.	Write CC File (0xE103) - using Cmd.WriteData .....	40
Tab. 9.	Example of CommMode.FULL on Cmd.Write to File No 0x02 .....	22	Tab. 26.	Example for Cmd.ChangeKey in Secure Messaging using Case 1 .....	40
Tab. 10.	ISO14443-4 PICC Activation .....	24	Tab. 27.	Example for Cmd.ChangeKey in Secure Messaging using Case 2 .....	41
Tab. 11.	Select NDEF Application using Cmd.ISOSelect .....	25	Tab. 28.	Enabling Random ID - RID .....	43
Tab. 12.	Get file settings of NDEF File .....	26	Tab. 29.	Get NTAG 424 DNA's UID .....	45
Tab. 13.	Get Version .....	27	Tab. 30.	Asymmetric Originality Signature verification .....	51
Tab. 14.	Cmd.AuthenticateEV2First using Key No 0x00 .....	29			
Tab. 15.	NDEF Message Creation .....	30			
Tab. 16.	NDEF Message Creation .....	31			
Tab. 17.	Write NDEF File - using Cmd.ISOUpdateBinary .....	32			

## Figures

Fig. 1.	UID, NFCCounter (PICCData) and CMAC mirror .....	8	Fig. 8.	Plain communication in SSM .....	20
Fig. 2.	E(UID + NFCCounter = PICCData), CMAC mirror .....	8	Fig. 9.	MACed communication in SSM .....	21
Fig. 3.	E(PICCData), E(TagTamper status) and CMAC mirror .....	9	Fig. 10.	Fully enciphered communication in SSM .....	22
Fig. 4.	E(PICCData), E(Static File Data) and CMAC mirror .....	9	Fig. 11.	Failed authentication counter processing during the first part of the Authentication .....	47
Fig. 5.	NFC Reader/Writer technology poll .....	9	Fig. 12.	Failed authentication counter processing during the second part of the Authentication .....	48
Fig. 6.	NTAG 424 DNA Secure messaging options ....	19	Fig. 13.	NFC and cloud integration .....	52
Fig. 7.	SSM Session Key generation after successful Authentication .....	20	Fig. 14.	Main use case system concept .....	52
			Fig. 15.	Offline system concept using SE and Crypto processor .....	53

## Contents

<b>1 Abbreviations .....</b>	<b>3</b>	6.11 ISO SELECT Proprietary file by EF Name .....	36
<b>2 Introduction .....</b>	<b>4</b>	6.12 Write to Proprietary File - using Cmd.WriteData, CommMode.FULL .....	37
2.1 About this document .....	4	6.13 ISO SELECT CC file by EF Name .....	38
2.2 Key benefits using NTAG 424 DNA .....	4	6.14 AuthenticateAESNonFirst with key 0x00 .....	39
2.3 Target applications .....	4	6.15 Write to CC - using Cmd.WriteData, CommMode.PLAIN .....	40
2.4 Standards compliancy .....	5	6.16 Changing the Key .....	40
2.4.1 ISO 14443 .....	5	6.16.1 KeyNo to be changed does not equal AuthKey .....	40
2.4.2 ISO 7816-4 .....	5	6.16.2 KeyNo to be changed equals AuthKey .....	41
2.4.3 NFC Forum compliancy .....	5	<b>Special functionalities .....</b>	<b>43</b>
<b>3 Definition of variables used in examples .....</b>	<b>6</b>	7 Configuration of NDEF application and PICC attributes .....	43
3.1 Byte order .....	7	7.1 Random ID - RID .....	43
3.1.1 LSB representation .....	7	7.2 Get UID .....	44
3.1.2 MSB representation .....	7	7.3 Failed Authentications Counter .....	45
<b>4 Secure Dynamic Messaging (SDM) .....</b>	<b>8</b>	7.4 TagTamper .....	48
4.1 Mirroring commons .....	8	7.5 SDMReadCtr Limit .....	49
4.2 SUN generation procedure .....	9	<b>8 Originality Signature Verification .....</b>	<b>50</b>
4.3 SDM Session Key Generation .....	10	8.1 Symmetric check .....	50
4.4 SUN Mirroring .....	10	8.2 Asymmetric check .....	50
4.4.1 PICCData mirror .....	10	<b>9 System implementation concepts .....</b>	<b>52</b>
4.4.2 PICCData Encrypted mirror .....	11	9.1 Online system .....	52
4.4.2.1 Encryption of PICCData .....	11	9.2 Offline system .....	53
4.4.2.2 Decryption of PICCData .....	11	<b>10 Supporting tools .....</b>	<b>54</b>
4.4.3 SDMENCFFileData mirror .....	13	10.1 Software .....	54
4.4.3.1 Encryption of SDMENCFFileData .....	13	<b>11 References .....</b>	<b>55</b>
4.4.3.2 Decryption of SDMENCFFileData .....	13	11 Legal information .....	56
4.4.4 SDMMAC mirror .....	14		
4.4.4.1 SDMMAC .....	14		
4.4.4.2 SDMMAC calculation .....	14		
<b>5 Standard Secure Messaging (SSM) .....</b>	<b>19</b>		
5.1 SSM Session Keys generation .....	20		
5.2 CommMode.Plain .....	20		
5.3 CommMode.MAC .....	21		
5.4 CommMode.Full .....	22		
<b>6 Personalization example .....</b>	<b>24</b>		
6.1 ISO14443-4 PICC Activation .....	24		
6.2 Originality signature verification .....	25		
6.3 ISO SELECT NDEF application using DF Name .....	25		
6.4 Get File Settings .....	26		
6.5 Get Version .....	27		
6.6 AuthenticateEV2First with key 0x00 .....	29		
6.7 Prepare NDEF message .....	30		
6.7.1 NDEF .....	30		
6.7.2 NDEF Length .....	31		
6.7.3 NDEF Length and header .....	31		
6.7.4 Prepare NDEF message .....	31		
6.8 Write NDEF file .....	31		
6.8.1 Write NDEF File - using Cmd.ISOUpdateBinary, CommMode.PLAIN .....	32		
6.8.2 Write NDEF File - using Cmd.WriteData, CommMode.FULL .....	32		
6.9 Change NDEF File Settings .....	34		
6.10 AuthenticateEV2First with key 0x03 .....	35
